
Assignment – 2

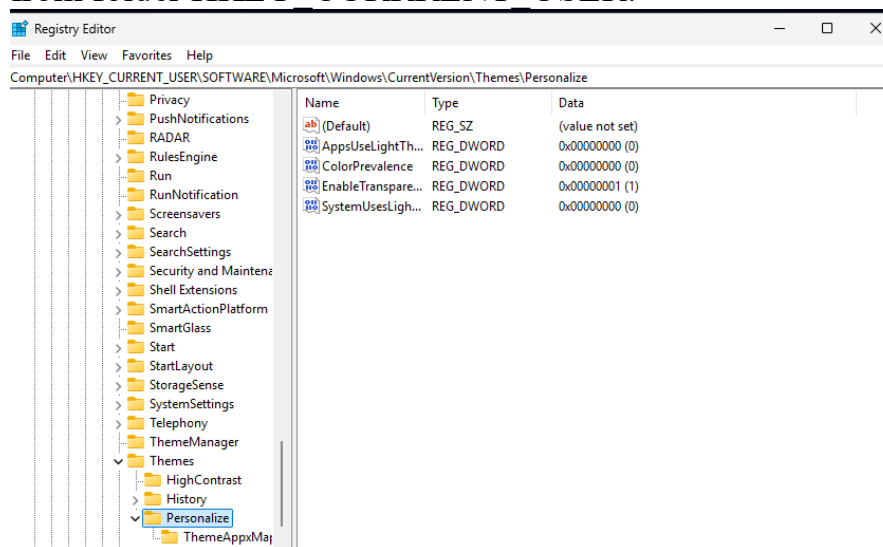

Bolatbekov Nurzhas CS-2424

PART – 1

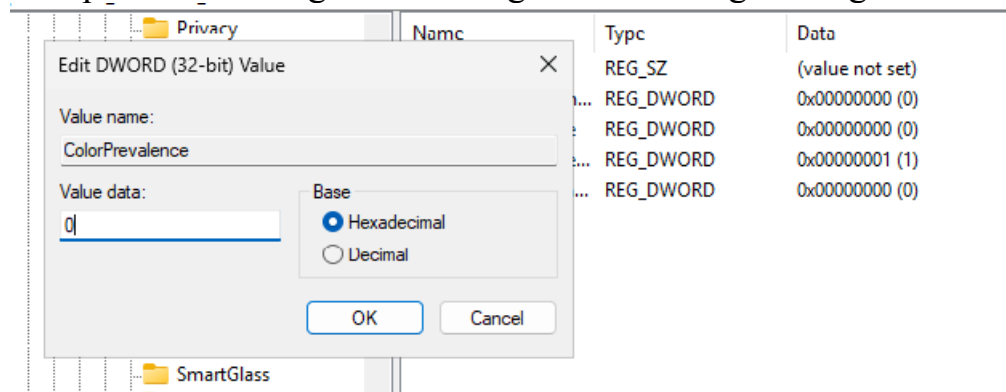

First we open registry editor:

2-step we navigate to personalize folder to make some changes it all starts from folder HKEY CURRENT USER:

3-step next we changed the setting with dark/bright using 0 and 1:

4-step then we open command line and then execute a command to change an operating system property after that we check it:

```
C:\Users\vboxuser>netsh interface ipv4 set address name="Ethernet" static 192.168.0.100 255.255.255.0 192.168.0.1
The filename, directory name, or volume label syntax is incorrect.

C:\Users\vboxuser>ipconfig

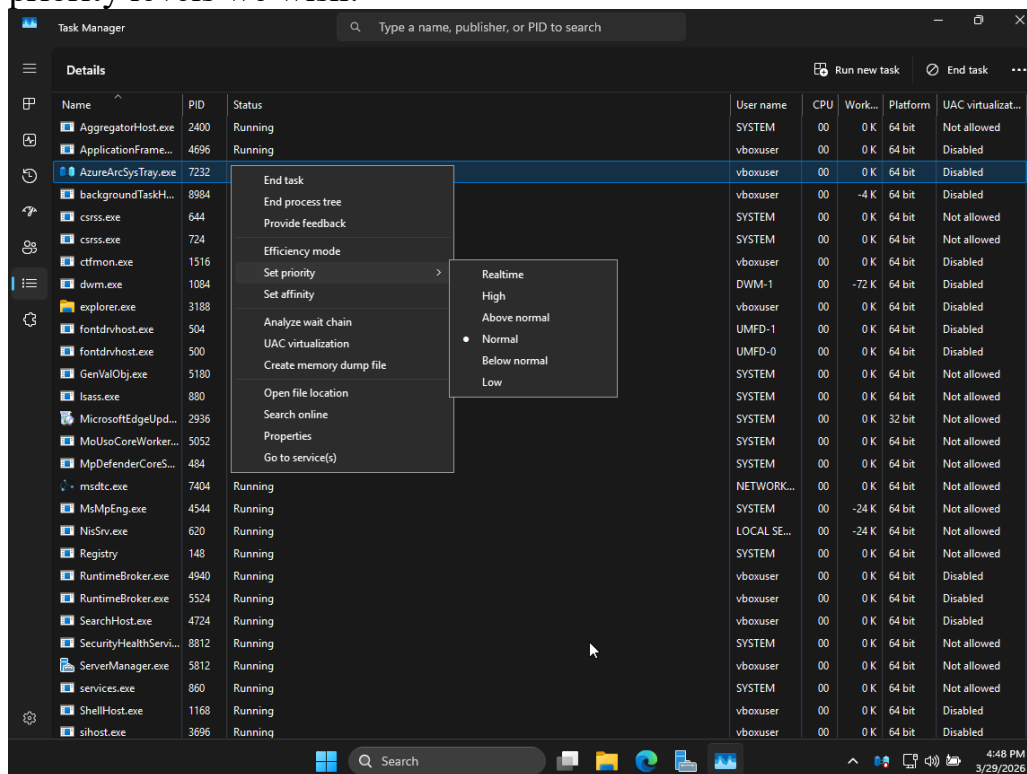

Windows IP Configuration

Ethernet adapter Ethernet:

    Connection-specific DNS Suffix  . : 
    IPv6 Address. . . . . : fd00::d197:40c6:3834:8a54
    Link-local IPv6 Address . . . . . : fe80::248f:3c59:1c24:c1d%8
    IPv4 Address. . . . . : 10.0.2.15
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : fe80::2%8
                                10.0.2.2
```

In my case it did not work but it is not important I know what we did and it proved the demonstration part.

5-step Then we open task manager (our buddy) and look around after we can change priority levels we wish:

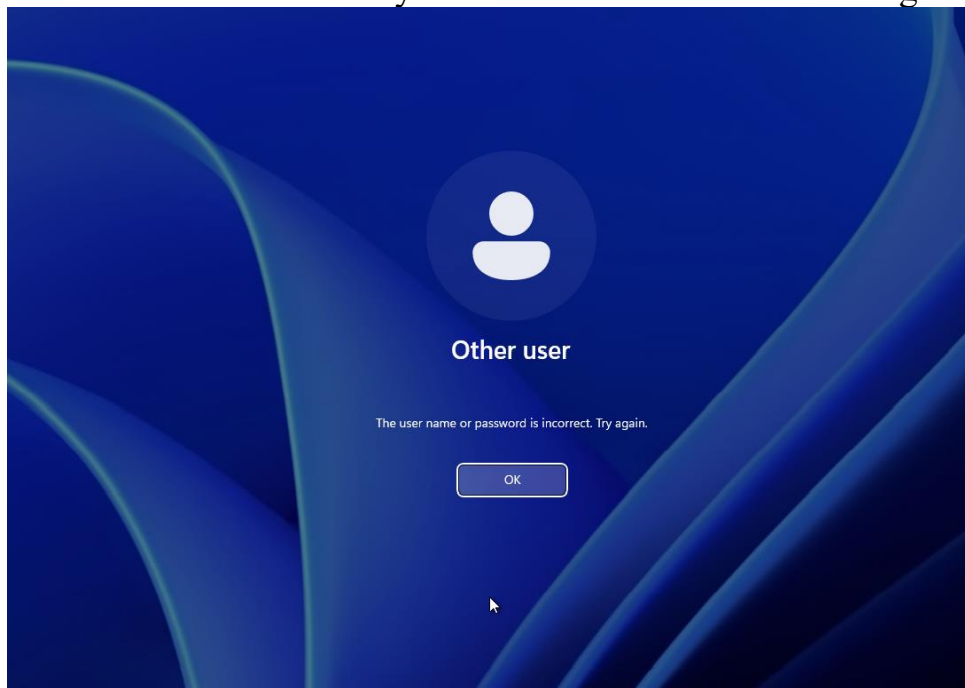

We finished with PART-1 and move on to PART-2 where no need for screenshots.

PART – 3

Task – 1

When I tried to enter to my user it failed even if I wrote it right.

Task – 2

What is User Rights Assignment?

User Rights Assignment defines what actions users are allowed to perform on a system, such as logging on locally, accessing the network, shutting down the system, and more. These policies control security and permissions for users and groups.

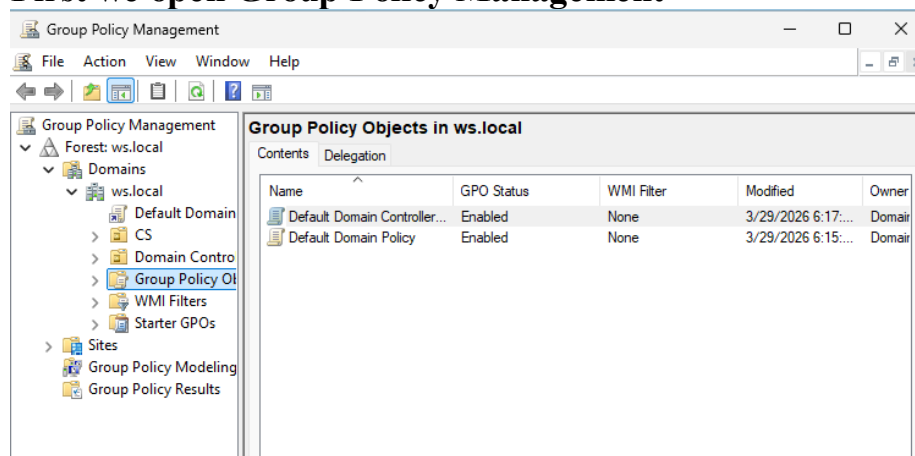

Examples

- Allow log on locally
- Deny log on locally
- Access this computer from the network
- Shut down the system

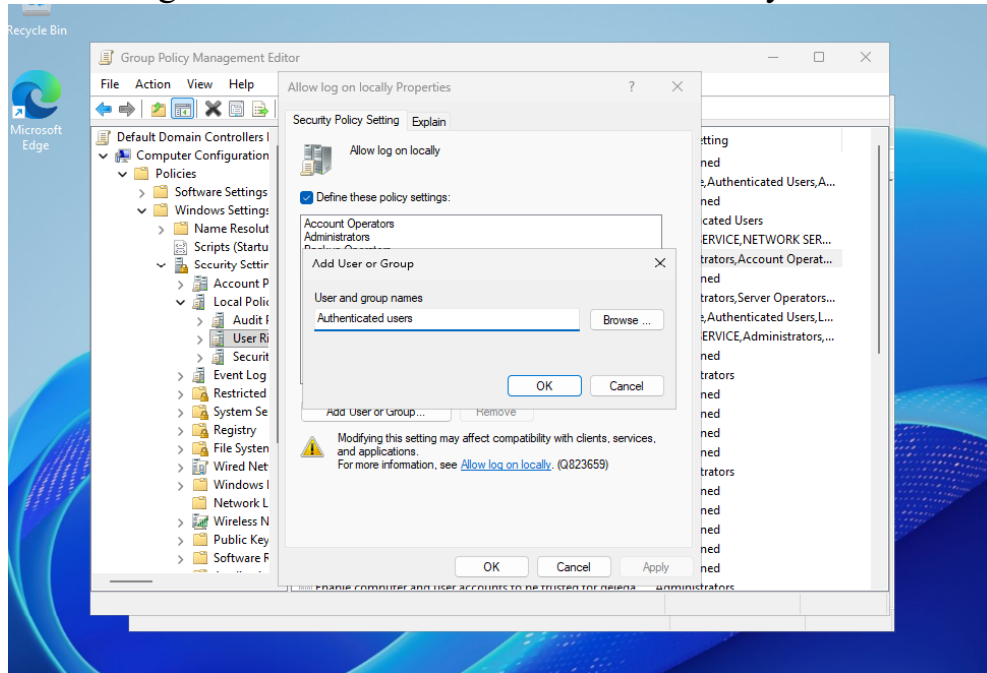

Difference:

Local Group Policy Editor applies only to a single computer and affects only that machine. Domain Controller Policy Settings are applied across the entire domain and affect all users and computers within the domain. Domain policies have higher priority and override local policies.

Task – 3 Allow user to log in First we open Group Policy Management

Then navigate to default Domain Controllers Policy and then Edit it:

Then We update policies to apply changes we made:

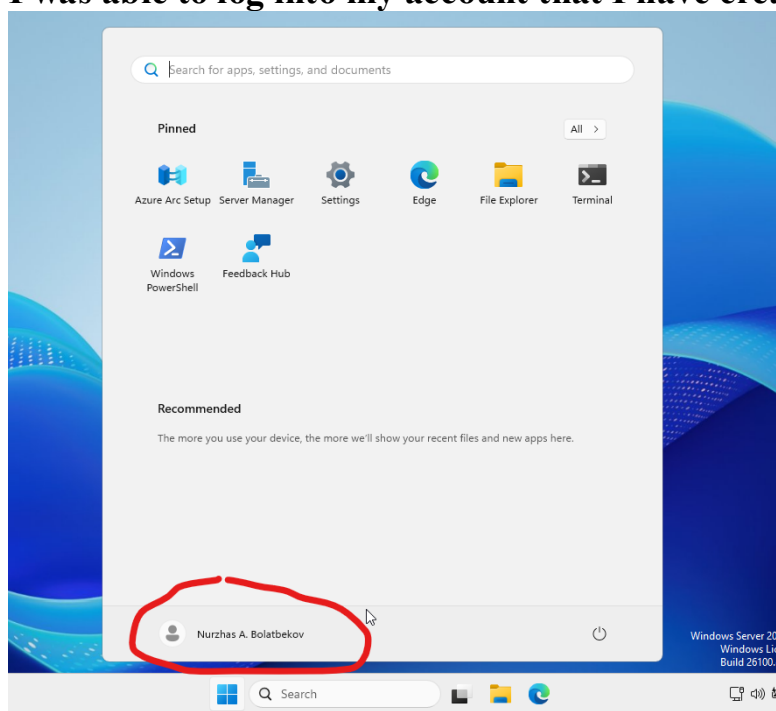

```
Microsoft Windows [Version 10.0.26100.32230]
(c) Microsoft Corporation. All rights reserved.

C:\Users\Administrator>gpupdate /force
Updating policy...

Computer Policy update has completed successfully.
User Policy update has completed successfully.

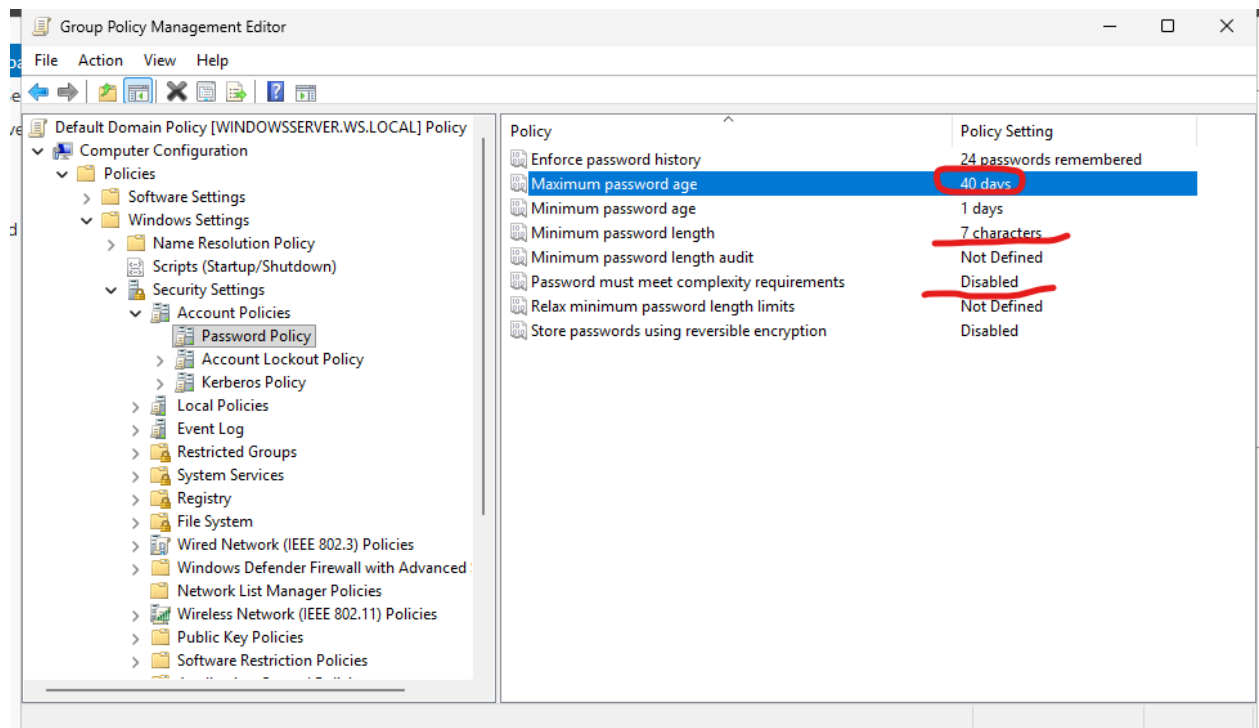

C:\Users\Administrator>
```

The issue was resolved by modifying the “Allow log on locally” policy and adding the user (or Authenticated Users), which granted permission to log in to the system. **I was able to log into my account that I have created**

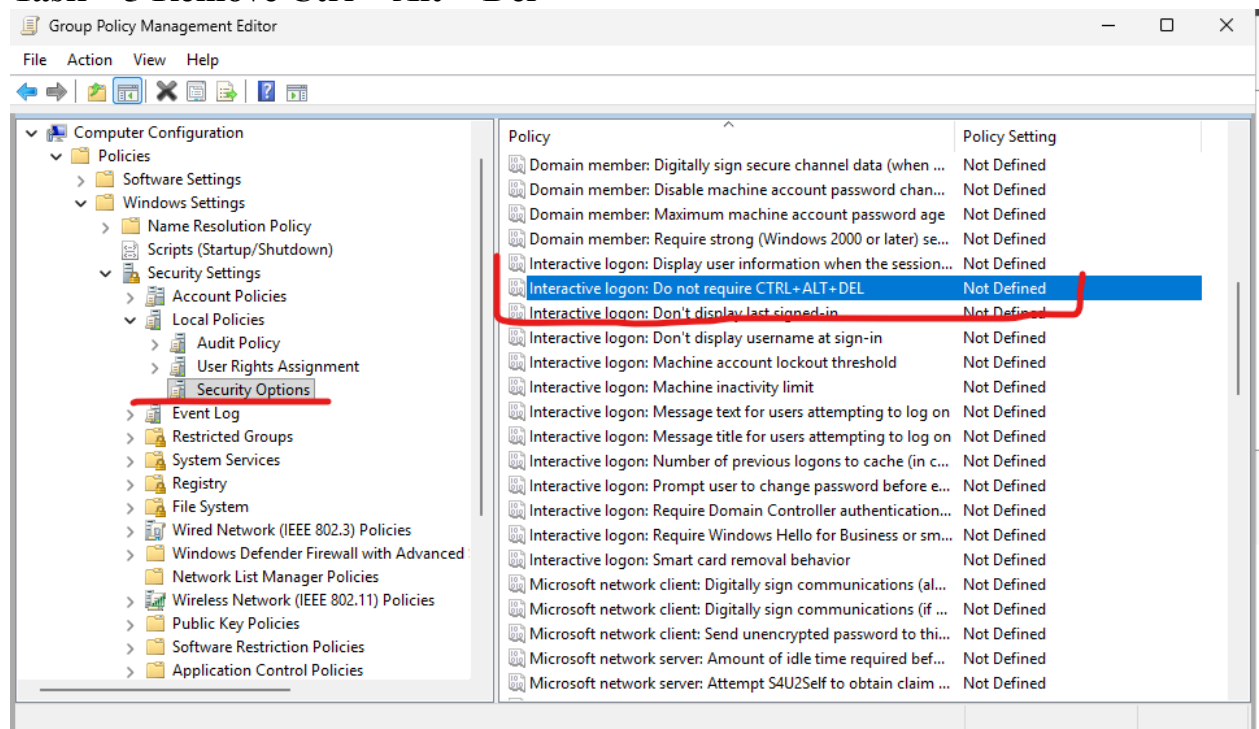

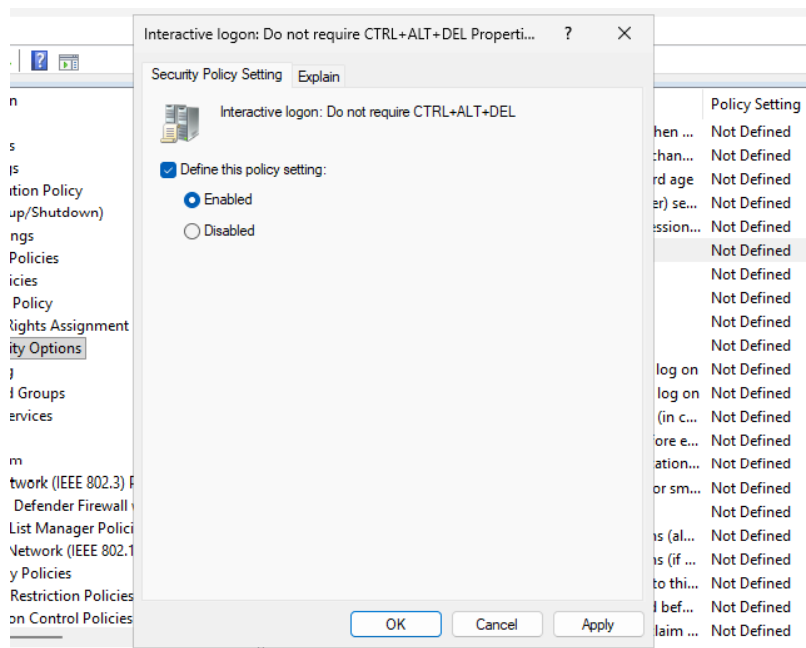

Task – 4: Change password policy

Now I changed password policy as it was required in the assignment:

Task – 5 Remove Ctrl + Alt + Del

The Ctrl+Alt+Del requirement was removed by enabling the policy “Interactive logon: Do not require CTRL+ALT+DEL” in the security settings.

Conclusion:

In this assignment, I learned how to install and work with Active Directory on Windows Server. I created a domain, added a new user, and managed it using different tools. At first, the user could not log in, but I fixed it by changing the Group Policy settings.

I also changed the password rules and removed the Ctrl+Alt+Del requirement. This helped me understand how security settings work in a server environment.

Overall, this assignment helped me gain practical experience with user management and system configuration.
